

Measuring the Radius of a Rounded Corner

Shown above is the measurement of a radius corner (Dotted lines) Listed below are a couple of different ways used in measuring the radius. For best results measure the spa instead of old cover. Make sure you measure the radius on ALL corners, not all corners are the same. We recommend using the smallest measurement for a uniform cover look. **Warning!** If your not sure of your measurments, it's always better to go with a smaller radius (illustrated on next page). A smaller radius will overhang the spa, where as a larger radius will not cover the edge completely.

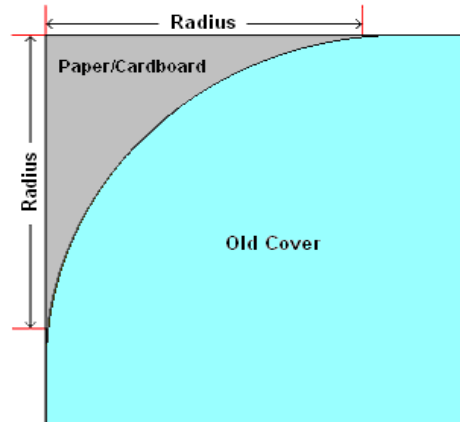

Option #1

Using a Carpenter's Square, align the straight edges of the square with the straight edges of the spa cover. Measure the distance between where the cover begins to curve to the **INSIDE** corner of the square (Shown Below) This is your radius.

Option #2

Flip cover over and place on top of a piece of newspaper or cardboard and align the straight edges of the spa cover with the edges of the paper/cardboard. Now measure from the corner of the paper/cardboard to the point where the spa cover completely covers the paper/cardboard (Shown below) This is your radius.

The below picture illustrates how a smaller radius (Line A) will over hang the spa and a larger radius (Line C) will not fully cover the spa.
